(Nuclear News, August 1999)

Inquiry:
In section 6.6 two methods of measurement of Flux Symmetry have [sic] been suggested. The first is “Flux Distribution Method” (section 6.6.3) and the second is “Rod Worth Symmetry Method” (section 6.6.4). I would like to know if we are supposed to use both the methods and then compare the results or either of the two will do.

Response:
Either method for conducting the flux symmetry test is acceptable, namely by either using the power distribution method or by using the control rod worth method.
